Mahatma Education Society's Pillai College of Engineering, New Panvel – 410206

CERTIFICATE OF APPROVAL

This is to certify that the requirements for the Bridge Course report entitled "BLOOD MANAGEMENT SYSTEM" has been successfully completed by the following students:

Name	Roll No.
RHUSHABH JAIN	323
SAHIL CHAUDHARI	309
AKSHAY GAIKWAD	320

In partial fulfillment of the Second year of Engineering in the Department of Computer Engineering, Pillai College of Engineering, New Panvel -410206 during the Academic Year 2022-2023.

Mini Project Coordinator

Prof.Sangeetha Selvan

Head of Department

Dr. Sharvari Govilkar

Acknowledgement

We would like to express our special thanks and gratitude to **Principal Dr. Sandeep Joshi**, **H.O.D. Dr. Sharvari Govilkar** and **Mini Project Coordinator Prof. Sangeetha Selvan** who gave us the opportunity to do this project as a part of Bridge Course Learning in the topic **BLOOD MANAGEMENT SYSTEM**, which helped us in applying the knowledge that we have acquired during the semester and learning new concepts.

We are immensely grateful to all of them for sharing their pearls of wisdom with us during this course.

Introduction

1.1 Introduction

The title of the project is 'Blood Management system'. A blood donation is a process whereby a person voluntarily has blood drawn to be used for future transfusions when in need at hospitals for treatment procedures that require them. Donation may be of whole blood (blood drawn directly from the body) or of specific components of the blood; such as red blood cells, white blood cells, plasma, and platelets. Blood banks often participate in the process of collecting blood and other procedures such as managing stocks, approving blood requests and updating donation information.

our python project (Blood management system) provides a menu such as home ,donor,register,donor, register, searchblood .our project enable user to register himself for blood donation. In registration form user needs to enter his personal credentials such as,name,gender,address,disease,etc. The information enter by the user will be safe and secure in the database.

Objective

2.1 Problem Definition

- Scarcity of rare blood group.
- Unavailability of blood during emergency
- Less awarness among people about blood donation and blood transfusion.
- Death's do to lack of blood during surgery.
- The blood management system project aims to make all the procedures automated and therefore with computer system it can be more fast and accurate.
- This project is high quality software to manage all these cumbersome jobs.

2.2 System Requirements: -

Here are the minimum hardware and software requirements:

Software Requirements:

OS: Windows 11, Windows 10, Windows 8 or MACos

Software: SQLITE 3 (any db browser), Idle (any editor).

Hardware Requirements:

Ram: 4 GB or higher recommended Processor: Intel Pentium 4 or higher

Methodology

3.1 FLOW OF MODEL

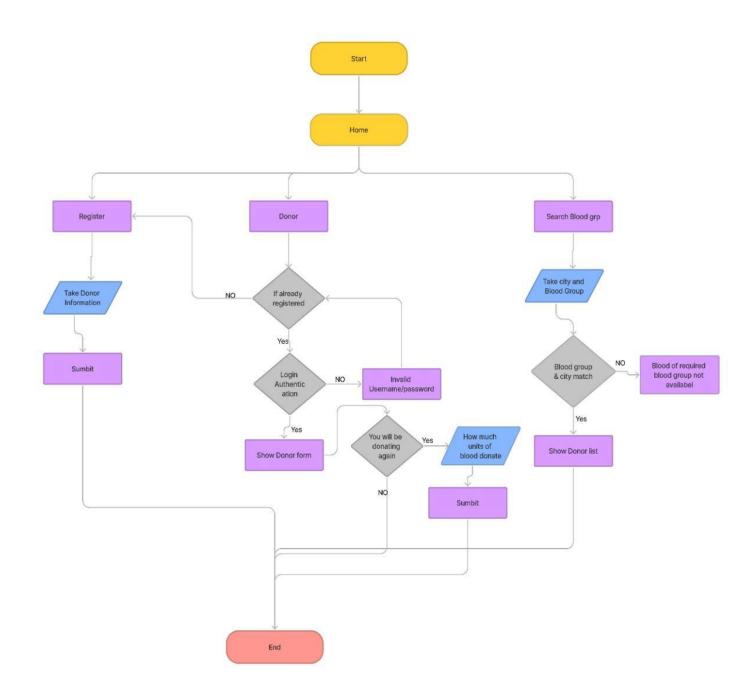

Fig1 - Flow Chart

3.2 TECHNOLOGIES USED:-

Python

Python is a multi-paradigm programming language. Object-oriented programming and structured programming are fully supported, and many of their features support functional programming and aspect-oriented programming

Python GUI-Tkinter

Graphical User Interface(GUI) is a form of user interface which allows users to interact with computers. **Tkinter** is the inbuilt python module that is used to create GUI applications. It is one of the most commonly used modules for creating GUI applications in Python as it is simple and easy to work with. You don't need to worry about the installation of the Tkinter module separately as it comes with Python already.

Python - DB browser (SQLITE 3)

Python SQLite3 module is used to integrate the SQLite database with Python. It is a standardized Python DBI API 2.0 and provides a straightforward and simple-to-use interface for interacting with SQLite databases. There is no need to install this module separately as it comes along with Python after the 2.5x version.

Implementation

4.1 System Overview

Blood management system is a GUI based system that serving the users throughout the world, The main idea of a system is to manage blood so hospitals will be able to provide blood to needy one's.

- Firstly user's need to create an account with all the basic information.
- If the user had already created his account then Log-In.
- If the user hasn't donated his blood, he needs to fill the registration form in order to donate his/her blood.
- Admin can perform operations like update ,delete,search but user's can only perform operations like register.
- For more information the user can navigate himself onto contact us.
- In order to gain insight of our project user's can navigate themselves onto us.

About Us

PCE BLOOD MANAGEMENT SYSTEM

Our Project "Blood Bank Management System" is a computerized system used to store and retrieve information related to Blood donations/inventory the project aims to expose the relevance and importance of Blood Management Systems. The system allows the admin/receptionist to store and retrieve information like blood donor details, blood receiver details, amount of blood present in the inventory of the blood bank store, etc.The Blood Bank Management System checks for the availability of a certain blood type like A+, A-, B+, B- etc.

Blood Bank Management System is designed to store, process, retrieve and analyze information concerned with the administrative and management in a blood bank. This project aims at maintaining all the information pertaining to blood donors, different blood groups available in each blood bank and helps them manage in a better way. The main Aim is to utilize the resources in a better way.

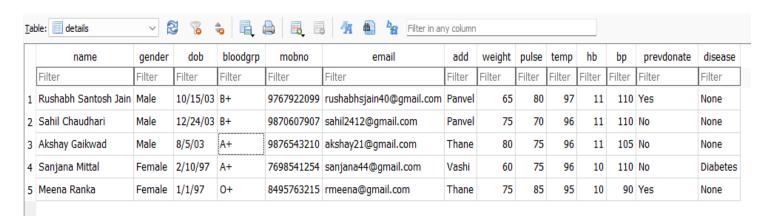

Fig10 - Database

Conclusion

5.1 Project Outcome

- In this Project we made a blood management system with the help of python, Sqlite3.
- BloodManagement System lightens the manual work for the donor. It also reduces the paper work and data lost.

5.2 Future Scope

- Sending sms or email to donor when anyone requires the blood .
- Managing the Hospitals and making availability of hospitals or blood banks on our GUI.
